Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   haemochromatosis (HFE) gene mutation in an individual comprising:

(a) providing DNA or RNA from the individual; and (b) assessing the DNA or RNA for the presence of a haplotype or genotype where the presence or absence of the haplotype genotype indicates the likely presence of the HFE gene mutation in the genome of the individual. The HFE gene sequences from the present invention can be used to develop products for use in the diagnosis and treatment of HFE. The present invention also describes BTF genes, which are homologues of the milk protein butyrophilin (BT), and can be used in the production of agonists and antagonists of BT function. Also described are: (1) a Roret gene which can be used to develop products for the study, diagnosis and treatment of lupus and Sjogren's syndrome; and (2) NPT3 and NPT4 genes which are homologues of a type I sodium transport gene, and can similarly be used for hypophosphatemia.

The present invention describes hereditary haemochromatosis gene products from the human haemochromatosis gene. The present sequence represents a hereditary haemochromatosis subregion from an individual unaffected by hereditary haemochromatosis (HH). Also described is a method to determine the presence or absence of the common hereditary haemochromatosis in an individual comprising:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               diagnosis; iron metabolism; NPT3; NPT4; RoRet; BTF1; BTF4; BTF5; milk protein; lupus; Sjogren's syndrome; type 1 sodium transport gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 98-240014/21.

Insertion of the sequences (Q47840-42) into plants such as rose, petunia, tobacco and carnation, using a suitable vector such as agrobacterium, give transformed plants which express the gene, resulting in petals with a bluer colour than normal, and/or pigmentation patterns which do not occur naturally. The sequences were amplified using primers (Q47843-70). Related single specific primers using a gene sequence coding for the haem-binding region o cytochrome P450 are shown in (Q4781-Q47903).

PT disorders, immune diseases, inflammation or blood disorders of the mune diseases, inflammation or blood disorders are deposited with the ATCC under deposit numbers ATCC encoding human secreted proteins (W8834 to W88756). The secreted protein compared protein containing the nucleic acid compared protein compared protein containing the nucleic acid compared proteins. The polynucleotide and amino acid sequences are useful for are useful for preventing, treating or ameliorating medical conditions e.g. compared protein compared proteins are described for each of the new polynucleotides. Dispersific uses are described for each of the new polynucleotides, based on compared protein 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       OS-SEP-199; US-US///.

          PT anti-S.aureus vaccines

Claim 1; Page 1557-1559; 3271pp; English.

CC This sequence represents one of 5191 Staphylococcus aureus DNA sequences

CC of the invention. The DNA sequences are recorded on a computer readable

CC memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using

CC the protein-encoding or regulatory regions of commercial, therapeutic or

CC industrial importance can be obtained. Specifically, sequences which are

CC inclustrial importance can be obtained. Specifically, sequences which are

CC inclustrial importance composition against S.aureus infection. The

CC or the protein-encoding or regulatory regions of commercial, therapeutic or

CC inclustrial importance can be obtained. Specifically, sequences which are

CC including can also be used in a kit for the immunodetection of

CC saureus in a sample. S.aureus is implicated in numerous human diseases,

CC including cellulitis, eyelid infections, food poisoning, osteomyelitis,

CC skin and surgical wound infections, scalded skin syndrome, toxic shock

CC for recombinant production of the polypeptides. The new DNA sequences

CC for their fragments) are useful as primers or probes for isolating

CC computer readable medium.

CC computer readable medium.

CC computer readable medium.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA encoding banana or lettuce polyphenol oxidase - useful in preventing browning in plants Claim 14; Fig 2; 33p; English.

Claim 14; Fig 2; 33p; English.

The present sequence, BANPPOl encodes banana polyphenol oxidase (PPO). It was derived by combining the sequences from various clones (BPO3, BPO17 and BPO26) isolated using degenerate (747685-87) and specific primers (747692-94). A number of clones were obtained from the banana fruit cDNA using primers B25 and GEN7 (747695-96). Most of these clones were identical to BANPPOl but one clone, designated BANPPOl1, was found to be distinctly different (see T47699). The primers were designed based on known plant PPO DNA sequences in the conserved regions of the gene which encode the copper binding sites, CuA and CuB. Antisense banana or lettuce PPO constructs can be used to decrease the level of PPO activity in a banana or lettuce plant. Decreasing the level of PPO is useful in preventing browning in plants.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC Human DNA polymerase alpha catalytic polypeptides were isolated from CC a human epidermoid carcinoma cell line, and seven peptides, T9, T19, CC T23, T24, T25, T264 and T265, were sequenced. Each peptide sequence was used to design anti-sense probes which were used to probe human CC KB cDNA libraries to recover positive colonies contg, fragments concoding DNA polymerase polypeptides. One cDNA clone obtd. was CC used to screen a a human pre-B cell cDNA library in lambda gt10 to obtain a full length clone. Initial attempts to functionally express the clone for human DNA polymerase alpha catalytic subunit resulted in truncated translation prods. Resequencing of five overlapping CC clones in conjunction with in vitro translation analysis revealed two frame shift mutations and two missense mutations in the two previously isolated cDNA clones, E1-19 and E1-12, that contain the 5 cend of the cDNA sequence. The sequence was mutated to correct the cariations and a full length ORF of 1462 amino acids produced. See also Q40921-49.

The complete nucleotide sequence of the genome of clone 6 of the baculovirus Autographa californica nuclear polyhedrosis virus (AcNPV) has been determined. The sequence is taken from the Genbank record 122858. The patent specification claims a polynucleotide selected from open reading frames (ORRs 13, 20, 22-26, 28-30, 32, 38, 41-46, 50-60, 62-63, 66, 68-79, 81-87, 91-92, 96-98, 101-103, 106-126, 129-130, 140-146, 148-150, 152 and 154 from a total of 154 ORFs identified by the patentees. See T13636-731. Expression vectors conty the complete genomic sequence of AcNPV, with the exception that at least one non-
                                                                                                                                                                                                                                                                                                           30-JUN-1995; IB0578.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note-"vector: pBeloBACII; Site_1: HindIII; Site_2: HindIII; Rice is one of two most popular grains in the world. Half of the world population especially those inhabiting highly populated areas of the humid tropics and subtropics, rely on rice as their primary source of carbohydrate. Monocotyledonous rice is a diploid plant (2n=24) with a haploid genome equivalent of 431 Mbp (Arumuganathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library form Oryza sativa, Nipponbare variety. The library contains 36,864 clones with an average insert size of 128.5 Kb providing 10.9 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Two high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /strain="Japonica"

                                                                                                                                                                                                                                                      /note="vector: pBeloBAC11; Site_1: HindIII; Site_2: HindIII; Rice is one of two most popular grains in the world. Half of the world population especially those inhabiting highly populated areas of the hund tropics and subtropics, rely on rice as their primary source of carbohydrate. Monocotyledonous rice is a diploid plant (2n=24) with a haploid genome equivalent of 431 Mbp (Arumuganathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library contains 36,864 clones with an average insert size of 128.5 Kb providing 10.9 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Two high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening. **

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .rl Barstead
14.5dpc embryos [total RNA provided by Minoru Ko, Wayne State Univ., from 2]; double-stranded cDNA was ligated Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library went through one round of normalization, and was constructed by Bento Soares and M.Fatima Bonaldo.

The sequence tag present in the CDNA between the NotI site and the
oligo-dr track served to identify it as a clone from the normalized
adult 8-Day-Embryo library. cDNA Library Preparation: M. Fatima
Bonaldo, Ph.D. Clone distribution: clones will be available through
Research Genetics The following repetitive elements were found in
this cDNA sequence: 1-44, >POLY_A#Simple_repeat
Seq primer: Ml3 Forward.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ALUJUH51 292 bp mRNA EST 11-FEB-1999 UI-R-CO-jp-b-03-0-UI.S1 UI-R-CO Rattus norvegicus cDNA clone UI-R-CO-jp-b-03-0-UI 3', mRNA sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       library consisted of a mixture of individually tagged normalized libraries constructed from 8, 12 and 18 day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dr track which allows identification of the library of origin of a clone within the mixture. The subtracted library (UI-R-CO) was constructed as follows: PCR amplified CDNA inserts from a pool of UI-R-Al and UI-R-El clones from which 3' ESTs had been derived was used as a driver in a hybridization with the pooled UI-R-Al and UI-R-El library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by droxyapatite column chromatography, converted to double-stranded circles and electroporated into BHIOB batteria (Life Technologies) to generate the UI-R-CO library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6: 791-806,
                                                                                                                                                                                                                                         nhlee@tigr.org

The UI-R-B1 libraries constructed from rat placenta, adult lung, brain, liver, kidney, heart, spleen, ovary, and muscle. The UI-R-B1 library consisted of a mixture of individually tagged normalized libraries constructed from RH 12 and 18 day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dT track which allows identification of the library of origin of a clone within the mixture. The subtracted library (UI-R-CO) was constructed as follows: PCR amplified cDNA inserts from a pool of UI-R-A1 and UI-R-B1 clones from which 3' ESTs had been derived was used as a driver in a hybridization with the pooled UI-R-A1 and UI-R-B1 library in the form of single-stranded circles. The remaining single-stranded circles subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electrocrated into nurse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                double-stranded circles and electroporated into DH10B bacteria (Life Technologies) to generate the UI-R-CO library. This procedure has been previously described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (Bonaldo, Lennon and Soares, 1996)"

Number of hits that pass the threshold
                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        December 29, 1999, 07:18:38; Search time 601.47 Seconds (without alignments) 248.818 Million cell updates/sec

                                                                                                                                                                                                                                                                                                                                                                                  where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence is the entire insert of clone 981L23. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure' feature les
                                                                                                                                                                                                                981123 is from the library RPCI5 constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Commission. Fourteen European sequencing laboratories, including the Sanger Centre, are participating in the project.

Protein coding regions (CDS) have been predicted with the help of computer analysis using the Genefinder program in PomBase (an ACEDB database) with additional predictions for the branch-acceptor sites supplied by the program Sp3splice. CANTON: It is possible that for any individual CDS we may have underestimated or overestimated the splice donor/acceptor sites. CDS are numbered using the following system eg Sp825H2 Olc. SP (S. Pombe), B (chromosome 2), c25H2 (cosmid name), Ol (first CDS), c (complementary strand).

The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.

IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we arrange for a small overlappend at the 5' end by cosmid c663, EMBL entry SPCC663, accession number analyzance may return cord.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (URL, http://www.sanger.ac.uk/Projects/S_pombe/)
During 1995 to 1996 about 66% of S. pombe chromosome 1 was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AL049521

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             source
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           In the work of the coverlapping clone assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, EMBI; SW:, SWISSPROT; Tr:, TREMBI; Wp:, WORNPEP; Information on the WORNPEP database can be found at the entire insert of clone 1145123. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence an annotation using the 'unsure' feature key.

This sequence was generated from part of bacterial clone contigs of human chromosome X, constructed by the sanger Centre Chromosome X Mapping Group. Further information can be found at http://www.sanger.or/k/Hrx
                                                                                                                                                                                                                                                                                                                                                                                         1 CAGATCTAGATACTATGTTCTACACTCTTACGT 33

```

COMMENT

TITLE

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed This sequence was finished as follows unless otherwise noted: by restriction digest.

MAPPING INFORMATION:

This sequence was generated from part of bacterial clone contigs human chromosome X, constructed by David Bentley's chromosome X mapping group at the Sanger Centre, Wellcome Trust Genome Campus, Hinxton, UK. Further information can be found at http://www.sanger.ac.uk/HGP/Chrx

This clone was derived from human PAC library RPCI-1 prepared by Pieter de Jong and coworkers at Roswell Park Cancer Institute, using the method described by Ioannou et al., Nature Genetics 6:84-9 (1994). The library is from one male donor. For further details, see http://bacpac.med.buffalo.edu/ The clone is available from Genome Systems, Inc. (http://www.genomesystems.com). SOURCE INFORMATION: pCYPAC2

NEIGHBORING SEQUENCE INFORMATION: The actual start of this clone is at base poactual end is at 147102 of H_DJ318C15. The clone is unknown position 1 of H_DJ318Cl5; he orientation of this

(NID: 9860548) This clone contains STS's WI-13810 (NID:g1343514) and WI-9475

* NOTE: This is a 'working draft' sequence. It currently

* consists of 3 contigs. The true order of the pleces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Buffer:
